ACTION STEPS TO OIL SPILL RESPONSE IN THE STATE OF MAINE

1. Keep calm but respond rapidly.
2. Evaluate fire and safety hazards.
3. Stop the source in order to minimize environmental damage.
4. Keep oil from reaching water, if possible.
5. Notify your supervisor and tell him:
 - A. What hazards exist, any injuries
 - B. What was spilled
 - C. How much was spilled
 - D. Immediate effect of spill
6. Notify the
 - A. Maine Department of Environmental Protection
1-800-482-0777 (24 hour toll-free number)
1-207-772-2857 (Out-of-State calls)
 - B. U.S. Coast Guard (If in tidal waters)
1-800-424-8802, 772-8640 or 780-3251 (Southern Area)
or 469-7911 (Northern Area)
 - C. U.S. Environmental Protection Agency (inland spills)
1-617-223-7265
 - D. Fire Department, if Fire Hazard Exists
7. Contain the spilled oil once in water.
8. Remove spilled oil and contaminated debris. This can be accomplished under the discharger's supervision with his own personnel or by oil spill clean-up contractors.
9. Dispose of oil and contaminated debris in a manner approved by the Maine Department of Environmental Protection.

Failure to report and clean-up an oil spill may result in fines of up to \$25,000 for each day of such violation.

Record of Changes and Corrections

[illegible]

Foreword

In the event of an oil spill it is essential that proper authorities be notified and a plan of action quickly established to minimize the potential damage to the environment. To that end, this contingency plan has been compiled to assist in providing the petroleum handling facilities throughout the State of Maine with a ready reference of equipment and material available with which to combat spills, be they minor or major in magnitude.

This plan is divided geographically into two segments, i.e., northern and southern areas. The northern area consists of the territory north of the following line - Route 17 between Rockland and Augusta, Route 27 between Augusta and Farmington and Route 4 between Farmington and Rangeley. Territory to the south of this route will comprise the southern area.

This plan will serve to augment the existing contingency plans of the U.S. Coast Guard for coastal waters and the plans of the U.S. Environmental Protection Agency for inland waters.

This plan will be updated periodically as the need arises.

I.

Objectives

The objectives of this plan are to develop appropriate preventive and preparedness measures and effective systems for reporting the existence of an oil spill incident; to institute promptly the measures to restrict the further spread of the pollutant; to assure that the public health and welfare are provided adequate protection; apply techniques to clean-up and dispose of the collected pollutants; to provide for a scientific response to spills as appropriate; to provide adequate equipment to respond to oil spills and to effect enforcement of the existing State law.

II.

Excerpts from the Maine Oil Discharge Prevention
And Pollution Control Law

The following excerpts are a brief summation of the State of Maine Oil Discharge Prevention and Pollution Control Law (Title 38, Chapter 3 M.R.S.A.). A complete copy of the statutes can be found in the back of this contingency plan.

§542 Definitions

3. Board. "Board" shall mean the Board of Environmental Protection.
4. Discharge. "Discharge" means any spilling, leaking, pumping, pouring, emitting, emptying or dumping.
5. Fund. "Fund" shall mean the Maine Coastal Protection Fund.
6. Oil. "Oil" means oil, petroleum products and their by-products of any kind and in any form including, but not limited to, petroleum, fuel oil, sludge, oil refuse, oil mixed with other wastes, crude oils and other liquid hydrocarbons regardless of specific gravity.
9. Person. "Person" shall mean any natural person, firm, association, partnership, corporation, trust, the State of Maine and any agency thereof, governmental entity, quasi-governmental entity, the United States of America and any agency thereof and any other legal entity.

§543 Pollution and corruption of waters and lands of the State prohibited

The discharge of oil into or upon any coastal waters, estuaries, tidal flats, beaches and lands adjoining the seacoast of the State, or into any river, stream, sewer, surface water drain or other waters of the State is prohibited.

1969, c. 572; 1977, c. 375, §5.

Notwithstanding the prohibition of this section, the Board of Environmental Protection may license the discharge of waste, refuse or effluent, including natural drainage contaminated by oil, petroleum products or their by-products, into or upon any coastal waters if, and only if, it finds that such discharge will be receiving the best available treatment and that such discharge will not degrade existing quality nor preceptibly violate the classification of the receiving waters, nor create any visible sheen upon the receiving waters.

In acting upon an application for any such license, the Board shall follow the provisions of Subchapter I insofar as they are applicable.

1970, c. 572, §1; 1973, c. 423, §11

§548 Removal of prohibited discharges

Any person discharging oil, petroleum products or their by-products in the manner prohibited by section 543 shall immediately undertake to remove such discharge to the Board's satisfaction. Notwithstanding the above requirement the Board may undertake the removal of such discharge and may retain agents and contracts for such purposes who shall operate under the direction of the Board.

Any unexplained discharge of oil, petroleum products or their by-products within State jurisdiction or discharge of oil, petroleum products or their by-products occurring in waters beyond State jurisdiction that for any reason penetrates within State jurisdiction shall be removed by or under the direction of the Board.

Any expenses involved in the removal of discharges, whether by the person causing the same, the person reporting the same or the Board by itself or through its agents or contractors shall be paid in the first instance from the Maine Coastal Protection Fund hereinafter provided for and any reimbursements due said fund shall be collected in accordance with the provisions of section 551.

1970, c. 572; 1972, c. 618

§550 Enforcement; penalties

Any person who causes or is responsible for a discharge in violation of section 543 shall not be subject to any fines or civil penalties if such person promptly reports and removes such discharge in accordance with the rules, regulations and orders of the Board.

§551 Maine Coastal Protection Fund

The Maine Coastal Protection Fund is established to be used by the Board as a nonlapsing, revolving fund for carrying out the purposes of this subchapter. The fund shall be limited to \$4,000,000 until July 1, 1978. Thereafter the fund shall be limited to \$6,000,000 and the Board of Environmental Protection shall collect fees in accordance with subsection 4. To this fund shall be credited all license fees, penalties and other fees and charges related to this subchapter, and to this fund shall be charged any and all expenses of the Board related to this subchapter, including administrative expenses, costs of removal of discharges of pollutants, and 3rd party damages covered by this subchapter.

1977, c. 375, §10

6. Reimbursements to Maine Coastal Protection Fund. The Board shall seek recovery to the use of the fund all sums expended therefrom, including overdrafts, for the following purposes, unless the Board finds the amount involved too small or the likelihood of success too uncertain; provided that recoveries resulting from damage due to an oil pollution disaster declared by the Governor pursuant to section 547 shall be apportioned between the Maine Coastal Protection Fund and the General Fund so as to repay the full costs to the General Fund of any bonds issued as a result of the disaster:

C. Requests for reimbursement to the fund if not paid within 30 days of demand shall be turned over to the Attorney General for collection;

§349 Penalties

1. Criminal penalties. Notwithstanding Title 17-A, section 4-A and except as provided in subsection 4, any person who violates any provision of the laws administered by the Department of Environmental Protection, or the terms or conditions of any order, regulation, license, permit, approval or decision of the Board of Environmental Protection shall be subject to a fine, payable to the State, of not more than \$25,000 for each day of such violation.

1977, c. 300, §9 and c. 510, §89

2. Civil penalties. Any person who violates any provision of the laws administered by the Department of Environmental Protection, or any order, regulation, license, permit, approval or decision of the Board of Environmental Protection shall be subject to a civil penalty, payable to the State, of not more than \$10,000 for each day of such violation.

III.

Scope

This plan will be effective on all inland and coastal waters to a distance of twelve miles from the coastline of the state. Section 543 of Title 38 prohibits the discharge of oil into or upon any coastal waters, estuaries, tidal flats, beaches and lands adjoining the seacoast of the state, or into any river, stream, sewer, surface water drain or other waters of the state.

Section 548 requires removal of a prohibited discharge to the satisfaction of the Board of Environmental Protection. Furthermore, it also allows for the Board's undertaking of clean-up action and similarly provides for the clean-up of any unexplained or "mystery" spills. Funding of Board authorized clean-up action shall be through the Maine Coastal Protection Fund.

Section 550 clearly states that any person who causes or is responsible for a discharge of oil into State waters shall not be subject to any fines or civil penalties if such person promptly reports and removes such discharges in accordance with the rules, regulations and orders of the Board.

IV.

Oil Spill Reporting ProcedureInitial Report

In the event of any petroleum product discharge, the person, firm, or corporation responsible for the discharge shall immediately undertake to remove such discharge. As soon as practicable, but within two hours, an initial telephone report shall be made to the Department of Environmental Protection to include the following:

- a. spillor and location
- b. time of discharge
- c. amount and type of product spilled
- d. cause of spill
- e. corrective actions being taken
- f. assistance required
- g. waterway effected
- h. name and telephone number of person making report
- i. other pertinent information

Final Report - Written

After removal of such discharge has been completed, the polluter shall prepare a complete written report of the occurrence and submit this report to the Division of Oil Conveyance Services within ten (10) days. If circumstances make a complete report impossible, a partial report shall be submitted. This report shall include, but not be limited to the following information:

- a. date, time and place of discharge
- b. name of polluter, name of owner of vessel involved
- c. amount and type of oil discharged
- d. complete description of circumstances causing discharge
- e. complete description of containment and removal operations including costs of these operations
- f. description and estimate of third party damages
- g. procedures, methods and precautions instituted to prevent a similar occurrence from reoccurring
- h. recommendations to the Board of Environmental Protection for changes in regulations or operating procedures
- i. name and address of any person, firm or corporation suffering damages from discharge and an estimate of the cost of such damages.

V.

Agencies to be Notified

Whenever a spill occurs, the following agencies should be notified:

A. Northern Area

1. State and Local Agencies

- a. Department of Environmental Protection
 - 1-800-482-0777
 - Out-of-State 1-207-772-2857
 - Bangor Field Office 947-6746
 - Presque Isle 764-3737
 - Augusta Office 289-2591
- b. Local Fire Department
- c. Local Police Department
- d. Maine State Police
 - Houlton 1-800-432-7384 or 532-2261
 - Augusta 1-800-452-4664 or 289-2155
 - Orono 1-800-432-7381 or 866-2121
- e. Local Harbormaster
- f. Department of Marine Resources 289-2291
 - Alpheus Dorr, Supervisor, Section III Ellsworth 667-9013
 - Roger Allen, Supervisor, Section IV Jonesboro 434-2761
- g. Department of Inland Fisheries and Wildlife 289-3371
 - Charles Tobie, Warden Supervisor Division B, North Monmouth 933-4448
 - Gene Mallory, Warden Supervisor Division C, Machias 255-6563
 - Gray Morrison, Warden Supervisor Division E, Greenville 695-2268
 - E. Ritchie, Warden Supervisor Division F, Lincoln 794-8998
 - Herbert Vernon, Warden Supervisor Division G, Fort Kent 834-5400

2. Federal Agencies

- a. U.S. Coast Guard 1-800-424-8802
 - Marine Safety Detachment - Bucksport 469-7911
- b. U.S. Environmental Protection Agency 617-223-7265

3. Non-governmental Agencies

- a. Penobscot River Oil Pollution Abatement Committee (PROPAC)
 - Harold Norris 548-2531
 - John Carlisle 942-6318

- b. Aroostook County Oil Pollution Abatement Committee
(AROOPAC)
Houlton - Lee Ludwig 532-6575
Presque Isle - Gene Michaud 768-5611
Fort Kent - Leo Robichaud 834-5027
- c. Knox County Oil Pollution Abatement Committee
(KNOXPAC)
Forest Grenier 594-5545

B. Southern Area

1. State and Local Agencies

- a. Department of Environmental Protection 1-800-482-0777
Out-of-State 1-207-772-2857
Portland Field Office 773-6491
Augusta Field Office 289-2591
- b. Local Fire Department
- c. Local Police Department
- d. Maine State Police
Augusta 1-800-452-4664 or 289-2155
Scarborough 1-800-482-0730 or 883-3473
- e. Local Harbormaster
- f. Department of Marine Resources 289-2291
Vaughan Crandall, Jr., Supervisor
Section I, Saco 289-2919
Wayne Smith, Supervisor
Section II, Warren 273-2531
- g. Department of Inland Fisheries and Wildlife 289-3371
Russell Dyer, Warden Supervisor
Division A, Steep Falls 675-3142
John March, Warden Supervisor
Division M, West Gardiner 582-2579
Vernon Moulton, Warden Supervisor
Division D, Strong 364-3023

2. Federal Agencies

- a. U.S. Coast Guard 1-800-424-8802
Marine Safety Office 780-3251
- b. U.S. Environmental Protection Agency 617-223-7265

3. Non-governmental Agencies

- a. Portland Harbor Pollution Abatement Committee
(PHPAC)
Edward Langlois 773-5608
(home) 799-0682
- b. Androscoggin and Little Androscoggin Oil Pollution
Abatement Committee (ANDYPAC)
Ray Pare 784-6348
Ron Berry 345-8461
- c. Portsmouth Harbor Oil Spill Committee (PHOSC)
Bill Young 603-431-5131

VI.

The Role of the State of Maine in Oil Spill Clean-up

In 1969, the Department of Environmental Protection was delegated the authority by the Legislature to deal with the threat to the environment caused by the discharge of petroleum and petroleum products into the waters of the State of Maine. Although this authority extends to areas other than clean-up, due to the nature of this manual only the role in clean-up will be discussed.

Briefly stated the role of the Department of Environmental Protection is seen as follows:

1. To investigate all supposed discharges of petroleum, or petroleum products, into the waters of the State of Maine.
2. To verify the nature of these discharges.
3. To determine the origins of these discharges, should they be found to be petroleum, or petroleum related products.
4. To locate the parties responsible for these discharges and to see that these discharges are immediately stopped.
5. To see that the environmental threat is kept to a minimum.
6. To see that steps are taken to immediately remove the pollutant.
7. To see that the pollutant and all associated contaminated debris are disposed of in a manner acceptable to the DEP.

In order to carry out these objectives the DEP has established, in addition to a central Augusta office, two regional field offices. One is located in Bangor and serves the area from Rockland to Eastport. The other is based in Portland and serves the area from Thomaston to Kittery.

Each of these offices are manned by personnel experienced in oil spill abatement and clean-up techniques. Additionally, each office is equipped with pumps, boom, skimmers, sorbents, and other related clean-up equipment, as well as the vehicles to transport and utilize this equipment. Also included are several boats, including three specifically designed for seaside clean-up operation.

It is the purpose of these men and equipment to be used as an initial response unit and to augment clean-up efforts by any contractor employed by the spiller to remove the pollutant. In addition the DEP is charged with monitoring the entire clean-up operation for the State.

In order to improve reporting and response time the DEP maintains a 24 hour - 7 day per week toll free number, 1-800-482-0777. This number is to be used by anyone wishing to report any suspected discharge of oil. Out-of-State callers should dial 1-207-772-2857.

VII. Division of Oil Conveyance Services Communications System

The Department of Environmental Protection communications system is designed to allow field personnel constant contact with each other and a regional field office during routine and emergency situations. In addition, each mobile and portable unit is equipped with channel 22-A to enable field personnel to communicate directly with the U.S.C.G. Pollution Investigation Teams.

The DEP presently maintains and operates two 50-watt base stations, KZN-571 in Bangor and KZN-516 in Portland. The base stations are equipped to receive and transmit on channels 79A (156.975 MHz) and 16 (156.8 MHz).

To supplement the base stations the DEP owns and operates 10 - 5 watt portable units and 7 - 25 watt mobile units. Each of these units is equipped with 79A and 22A, plus several other working frequencies.

The working frequency for DEP field operations is 79A (156.975 MHz).

VIII. The Role of the Federal Government in Oil Spill Clean-up

A. Government Agencies

1. U.S. Coast Guard

The discharge of petroleum into the navigable waters of the State of Maine is a violation of the Federal law as well as a violation of Maine's Title 38 M.R.S.A. Federal law requires all oil spills to be reported immediately by calling their toll-free number, 1-800-424-8802, in Washington. The U.S. Coast Guard is the designated Federal agency assigned the responsibility of responding to oil spills involving tidal waters. Two Coast Guard offices, the Marine Safety Office (MSO) in Portland and the Marine Safety Detachment (MSD) in Bucksport respond to all reported spills along the Maine Coast. In addition to the MSO and MSD offices, assistance can be obtained from Coast Guard stations at Jonesport, Southwest Harbor, Rockland, Boothbay Harbor and South Portland. A listing of the above Coast Guard offices and stations is as follows:

a. Captain of the Port

U.S. Coast Guard Marine Safety Office
P.O. Box 108, Downtown Station
Portland, Maine 04112
Tel: 207-780-3251 or 207-772-8640
Off Hours: 799-5531

b. U.S. Coast Guard Marine Safety Detachment

Bucksport, Maine 04416
Tel: 207-469-7911

c. Other Coast Guard stations which may provide assistance area:

1) Jonesport	207-497-2200
2) Rockland	207-596-6667
3) Southwest Harbor	207-244-5517
4) Boothbay	207-633-2643
5) South Portland	207-799-5531

d. In addition to local Coast Guard response personnel, the U.S.C.G. also maintains a specially trained unit known as the Strike Team. The Strike Team is a group of highly trained individuals whose expertise may be called upon in combating a potential oil spill at the request of the Federal On Scene Commander. The Team has access to sophisticated clean-up and abatement equipment such as high volume pumps and heavy-duty high sea boom. The Strike Team is based in Elizabeth City, North Carolina.

2. U.S. Environmental Protection Agency

The U.S. Environmental Protection Agency, Oil and Hazardous Materials Section, is the Federal agency which is responsible for responding to inland oil spills. Due to their large area of coverage and limited number of personnel, the EPA responds mainly to

major (10,000+ gallons) oil spills. Although EPA personnel do not frequently participate in oil clean-up operations in the State of Maine, the agency has proven to be helpful in several other areas such as contingency planning, guidelines for oily waste disposal programs, and biological studies relating to oil spills.

The EPA Region I Oil and Hazardous Materials Section office is located at:

60 Westview Street
Lexington, Mass 02173
Tel: 617-223-7265

B. Federal Planning and Response Elements

For spill response activities, Federal on-scene coordination is accomplished through a single, predesignated agent, the On-Scene Coordinator (OSC). He reports to and receives advice from a Regional Response Team (RRT) composed of appropriate representatives from the regional and district offices of the primary and advisory agencies and the appropriate State agency - in Maine, the Department of Environmental Protection Commissioner or his designated representative, the Division of Oil Conveyance Services Chief.

Regional Response Team

The Regional Response Team (RRT) consists of regional representatives of the primary and selected advisory agencies, as appropriate. The RRT shall act as an emergency response team performing response functions within the region. Additionally the RRT shall determine the duration and extent of the Federal response and when a shift of on-scene coordination is indicated by the circumstances or progress of a pollution spill.

Regional Response Teams have been established for both coastal and inland waters. A representative of the EPA shall act as Chairman of the Inland Regional Response Team. A Coast Guard official shall chair the Regional Response Team for tidal waters.

Maine's representative to the RRT's shall be:

Commissioner - Department of Environmental Protection
Ray Building
Augusta, Maine 04333
Tel: 207-289-2811
Alternate: Chief, Division of Oil Conveyance Services

The Inland Regional Response Team office is located at:

U.S. Environmental Protection Agency
Region I
60 Westview Street
Lexington, Mass 02173
Tel: 617-861-6700

The Tidal Waters Regional Response Team office is located at:

First Coast Guard District
150 Causeway Street
Boston, Mass. 02114
Tel: 617-223-6915

C. On-Scene Coordination

Coordination and direction of Federal pollution control efforts at the scene of a spill or potential spill shall be accomplished through an On-Scene Coordinator (OSC). The OSC is the single executive agent predesignated by the Federal Regional Plan to coordinate and direct pollution control activities in each area of the region. The Federal OSC shall work in concert with his State counterpart to ensure that he avails himself of the valuable input of local knowledge in forming his decisions and coordinating response activities.

The predesignated On-Scene Coordinator for the Maine sub-region when the Federal government is involved in inland spills is:

Chief, Oil and Hazardous Materials Section
U.S. Environmental Protection Agency
Region I, 60 Westview Street
Lexington, Mass 02173
Tel: 617-861-6700

The predesignated On-Scene Coordinator for the Maine sub-region when the Federal government is involved in tidal oil spills is:

Captain of the Port
U.S. Coast Guard Marine Safety Office
P.O. Box 108, Downtown Station
Portland, ME
Tel: 207-780-3251

D. Federal Funding

A pollution control fund, administered by the Coast Guard, has been established pursuant to subsection (K) of section 311 of the Federal Water Pollution Control Act Amendments of 1972. It is the policy of the Federal government that timely and effective action be taken to control and remove discharges of oil and hazardous substances into or upon the waters of the United States, adjoining shorelines, or into or upon the waters of the contiguous zone. Whenever the party responsible for such a discharge is unknown or fails to take appropriate action to remove or arrange for the removal of the pollutant, the Federal government, through a predesignated On-Scene Coordinator (OSC), is authorized to take such action as is necessary and the removal costs are charged to the Pollution Fund.

As a result of Maine's Coastal Protection Fund the Federal Pollution Fund is rarely used for spill incidents in the State of Maine. If and when the State of Maine seeks reimbursement from the Federal Fund for any future expenditures from the Maine Coastal Protection Fund, the State shall follow the reimbursement procedures as outlined in Section 1906 of the Region I Oil and Hazardous Substances Pollution Contingency Plan for Navigable Waters - Maine.

IX.

Joint Canada - United States
Response Team (JRT) for Marine Pollution

The Joint Canada - United States Response Team (JRT) for marine pollution is outlined in the Joint Canada - United States Marine Pollution Contingency Plan. The plan was put together to deal effectively with oil spills which may impact or threaten the coastlines of the United States and Canada. The following is an excerpt from the Plan regarding the functions of the JRT.

301 Joint Response Centers

301.1 The Joint Response Center (JRC) will be established in the facilities of the Party providing the OSC and ordinarily be shifted to the facilities of the other Party if the OSC is shifted to that Party.

302 Joint Response Teams

302.1 The Joint Response Teams (JRT) shall consist of representatives of certain agencies of the United States and Canada. They function as emergency teams and will be activated by agreement in the event of a pollution incident occurring within the areas encompassed by this Plan and its Annexes. A JRT may be activated for any other location which may be designated.

302.2 The United States Coast Guard member of a JRT will act as U.S. chairman when the JRC is established in the U.S.A., and the Canadian Regional Coordinator under the existant Federal Contingency Plan will act as Canadian chairman of the team when a JRC is established in Canada. The chairman of either Party may invoke the Plan (see section 203).

302.3 The functions of a JRT include planning, preparedness and response and are outlined below. These are not exclusive.

- (a) Develop procedures to promote a coordinated response by all agencies to pollution incidents.
- (b) Review post-incident reports from the OSC's on the handling of pollution incidents for the purpose of analyzing response actions and recommending needed improvements in the contingency plans.
- (c) Forward to the respective federal, state and provincial authorities relevant reports and recommendations including OSC's post-incident reports, JRT debriefing reports and recommendations concerning amendments to the Plan or the Annexes.

302.4 Some measure of response functions will be performed each time the plan is invoked. The degree of response will be subject to the demands of each particular situation. The specific response functions and responsibilities of the JRT are outlined below.

- (a) Monitor incoming reports and evaluate the possible impact of reported pollution incidents. To be at all times fully aware of the proposed actions of the OSC.
- (b) Coordinate the actions of the various agencies in supplying the necessary resources and assistance to the OSC. Assistance will normally be obtained through the appropriate member of a JRT.

- (c) Provide advice as required to the OSC. The JRT does not have operational control over the OSC.
- (d) May arrange the deployment of personnel to monitor the handling of the spill.
- (e) Recruit other agencies, industrial or scientific groups to play their appropriate parts in support actions by acting through the JRT or OSC.
- (f) Determine when a shift of OSC from one party to the other is indicated by the circumstances of the spill.
- (g) Provide a focal point for public information.
- (h) Coordinate the reporting on the status of the pollution incident to the respective national authorities.

The U.S. Coast Guard chairman of the JRT, when the JRC is located in the U.S.A., can be contacted at:

First Coast Guard District
150 Causeway Street
Boston, Mass 02114
Tel: 617-223-6915

Should it be necessary to contact Canadian officials for spill information, the following agencies may be called:

State of Maine
Guidelines for Response to
Oil Spills Originating in Canada

Response Policy:

The State of Maine has developed a petroleum spill response policy based on several years of experience with spills originating from all sources. The response policy for Maine is:

1. To react and prepare for potential events as well as to carry out rapid response on actual oil pollution events.

This policy shall be strictly adhered to in all cases or potential cases. One significant reason for this policy is "mitigation of damage claims".

2. All response efforts shall be at the maximum cost/benefit ratio for the purposes of:
 - a. Providing on-scene capabilities to counter a spill and mitigate damages before the oil comes ashore, while;
 - b. Acknowledging "false alarms: that may exist from possible "over reaction".
 - c. Ease in justifying expenditures necessary for recovery of costs.

General Provisions:

1. The State of Maine administers the Maine Coastal Protection Fund (hereinafter called MCPF) which is a \$6 million dollar oil pollution contingency fund created for the purpose of paying:
 - a. Administrative expenses, personnel expenses, and equipment costs.
 - b. All costs involved in the abatement of oil pollution.
 - c. Research and Development costs.
 - d. Payment of Third Party Damage Claims.
2. All oil spills entering or threatening to enter waters of the State of Maine are prohibited.
3. The State of Maine presently owns a tremendous amount of oil spill abatement equipment. This equipment is available for use by anyone, anytime, when in need of such equipment whether the spillor be known or unknown.

Response to Petroleum Spills:

1. Following notification of an oil spill within the Bay of Fundy on the East Coast of Canada, the State of Maine shall consider a response effort. The decision to respond and the type of response necessary shall depend on two factors:
 - a. Volume and type of spilled oil/time/location.
 - b. Probability of this oil entering waters under the jurisdiction of the State of Maine.

2. If the joint Canada-United States Marine Pollution contingency plan is invoked, the Maine Department of Environmental Protection, Bureau of Water Quality Control, Division of Oil Conveyance Services (hereinafter called D.E.P.) (207-289-2591) shall immediately contact the District I office of the United States Coast Guard (hereinafter U.S.C.G.) for the purpose of obtaining first hand accurate information relating to the spill.
3. Following receipt of all pertinent information, the D.E.P. shall assess the data independently and relay Maine's analysis of the situation to the predesignated U.S.C.G. On-Scene Coordinator (OSC) in advisory form.
4. The D.E.P. shall consult with the U.S.C.G. as to the threat to U.S. waters and inform the U.S.C.G. if any independent action is contemplated by the D.E.P. The D.E.P. shall, in all cases, make every effort to agree on joint action with the U.S.C.G.
5. If an agreement cannot be reached or if the location of the spilled oil cannot be readily determined, the D.E.P. will begin collection of spill equipment from inventory areas in the State and notify local contractors of possible action. These steps shall be taken only after the U.S.C.G. On-Scene Coordinator is notified.
6. The D.E.P. shall consult with the U.S.C.G. on response times, locations, and methods. If an immediate threat actually exists, the D.E.P. shall opt for quick action to protect the Maine coastline in an attempt to mitigate damage claims.
7. The logistics of response will be discussed with the U.S.C.G. prior to any implementation. Authorization to respond shall be sought by the D.E.P. from the Federal OSC prior to hiring any contractor or moving State equipment to the impact area. Precautionary measures may be taken independently by the D.E.P. if the U.S.C.G. is precluded from taking these steps by the scope of their legislation, or the polluter will not or cannot respond in a timely and effective manner.
8. The location for equipment and manpower response shall be discussed with the U.S.C.G. prior to deployment. The response areas shall be based on historical impact areas and/or other trajectory prediction methods.
9. Contractors hired by D.E.P. shall be retained at the agreed upon site until the spiller can provide an adequate team of men and equipment to take over the precautionary or clean-up operation. The clean-up contractor hired by the D.E.P. shall be dismissed immediately once the precautionary/clean-up operation has been assumed by the spiller, the Canadian government, or the United States government.
10. D.E.P. shall monitor the clean-up operation in conjunction with the U.S.C.G. until all clean-up is complete. The D.E.P. shall work closely with the contractor(s) to ensure that they are cleaning in a cost beneficial manner. The Federal OSC of the U.S.C.G. shall be informed of all D.E.P. actions throughout the entire clean-up operations.
 - a. If at any time the contractor (U.S. or Canadian) is not performing as effectively as required by D.E.P. standards, the D.E.P. may, after consultation with the U.S.C.G. and the Canadian government, either replace the contractor or otherwise take steps to improve the effectiveness or speed of the clean-up operation.

11. D.E.P. shall not make any press releases involving the volume of petroleum spilled until a figure is agreed upon by the U.S.C.G. and D.E.P. However, due to the nature of the D.E.P. public fund and due to D.E.P.'s obligation to notify the citizens of Maine when the MCPF is in use, the D.E.P. may at times, be unable to clear all press releases regarding Maine's response through proper U.S.C.G. channels.
12. The D.E.P. shall remain on-scene until such time as the U.S.C.G., the Canadian government, and the D.E.P. agree to terminate the response.

Other Matters of Importance:

1. The D.E.P. reserves the right to hire any and all aerial surveillance equipment it deems necessary to track the trajectory of a spill.
 - a. In all cases the D.E.P. shall attempt to utilize available U.S.C.G. aerial surveillance equipment on a joint basis.
2. D.E.P. has communications equipment available for use by any governmental agency upon request. The communicators available have various functions to allow for most circumstances. D.E.P. is licensed to operate communicators (hand-held, road vehicle, and watercraft) on channel 79A and 16.
3. D.E.P. shall pay all bills relating to the clean-up of spills which were ordered by D.E.P. regardless of the location of the physical work. Cost recovery for these response actions is required by law and shall be sought through proper legal channels.

Non-governmental Oil Spill Cooperatives

A. Androscoggin and Little Androscoggin River Oil Pollution Abatement Committee (ANDYPAC)

Ray Pare, Co-chairman 784-6348

Ron Berry, Co-chairman 345-8461

ANDYPAC is the newest oil spill cooperative in the State. The organization is composed of both oil dealers and industry in the Lewiston-Auburn area. Each member has pledged to assist fellow members in the event of a large spill.

The organization has purchased an aluminum workboat which is stored atop a State owned trailer. This trailer is loaded with clean-up materials and maintained by the Androscoggin County Bureau of Civil Emergency Preparedness located on the grounds of the Auburn Fire Department. A complete list of equipment can be found in Appendix III.

B. Aroostook County Oil Pollution Abatement Committee (AROOPAC)

Houlton - Attn: Lee Ludwig 532-6575

Presque Isle - Attn: Gene Michaud 768-5611

Fort Kent - Attn: Leo Robichaud 834-5027

AROOPAC is an informal association of Aroostook County oil dealers dedicated to mutual assistance in the event of a large oil spill in that county. The group is composed of three branches, which are located in Houlton, Presque Isle, and Fort Kent. State owned clean-up equipment is stored in each of these cities. A complete list of equipment and personnel to contact for permission to use this equipment may be found in Appendix III.

C. Knox County Oil Pollution Abatement Committee (KNOXPAC)

Forest Grenier, Chairman 594-5545

KNOXPAC was formed in 1974 by the oil dealers and waterfront businesses in the Camden-Rockland area. In addition to State owned equipment stored in a mobile trailer at the Rockland Fire Station, KNOXPAC had purchased and stockpiled a quantity of oil sorbent materials. KNOXPAC's inventory is stored at National Sea Products, Inc. in Rockland

The organization was established with the purpose of providing mutual aid to members during oil spill emergencies. As with several other existing cooperatives in the state, the local fire departments play an important role in the organization.

A list of KNOXPAC's equipment may be found in Appendix III.

D. Portland Harbor Pollution Abatement Committee (PHPAC)

Edward Langlois 773-5608
 799-0682 (home)

PHPAC is an oil pollution abatement organization supported by local oil industry in the Portland area. The Committee is considered to be one of the forerunners in the establishment of mutual aid groups with the State of Maine.

Although active in actual oil spill clean-up in the past this Committee now serves as a support and advisory group in the organization of clean-up efforts.

PHPAC maintains and operates a heliport located on the roof of the Maine State Pier located at 40 Commercial Street, Portland, Maine. This landing pad makes it possible for quick aerial reconnaissance once a spill is detected.

E. Portsmouth Harbor Oil Spill Committee (PHOSC)

Bill Young, Chairman 603-431-5143

The PHOSC is a mutual aid group composed of interested parties, including the Piscataqua River terminals and Portsmouth Naval Shipyard. Its function is to support and advise any oil spill clean-up, or abatement, activities occurring in New Hampshire.

The Committee owns no equipment. When an oil spill occurs, they utilize the equipment of the Portsmouth Naval Shipyard and independent terminals on an agreement basis.

Although not within the State it is anticipated that this Committee's assistance would be available should the need arise.

F. Penobscot River Oil Pollution Abatement Committee (PROPAC)

Hap Norris, Chairman 548-2531

This organization is composed primarily of the "oil terminal facilities" in the Searsport, Bucksport and Bangor-Brewer areas. PROPAC's function is to prevent and control oil spills in the Penobscot River and Bay area. To accomplish this goal the organization has purchased and maintains several thousand feet of containment boom, workboats, skimmers, and sorbent materials. This equipment is available for oil pollution control to members free of charge and to non-members at commercial rates.

PROPAC's equipment is stored at several strategic locations in each of the above named towns. Permission to use the equipment can be obtained by calling Hap Norris (548-2531) at C.H. Sprague and Son Company, Searsport. A complete list of PROPAC equipment may be found in Appendix III.

Control and Clean-up of Spilled Oil

A. Oil on the Water

1. Introduction

By law, once oil has been spilled it must be removed as soon as possible. To accomplish this, several steps must be taken.

- a) The spilled oil must be contained
- b) The oil must be removed from the water
- c) The oil must be disposed of in such a manner that it no longer threatens the environment.

When an oil spill occurs, no matter what the size, the spiller must follow these steps if the clean-up is to be effective. The following discussion examines containment and removal and describes several of the techniques available today in order to carry them out.

2. Containment Methods

a. Boom

Before oil can be collected it must first be contained. The common method of accomplishing this is by using a device known as a boom. A boom may be composed of any material which will float upon the surface of the water and can be deployed in such a way as to prevent the spread of oil. In the past, such materials as logs, telephone poles, and planks have been used.

Today, however, more sophisticated booms have been developed. This has made the use of logs and other materials obsolete, under most conditions.

1) Boom Construction

Commercially available booms float atop the water by means of a floatation chamber filled with air, foam or other type of floatation material. Oil containment is enhanced by a skirt which extends downward into the water. These skirts are generally weighted in such a manner as to keep the boom upright in the water. Oil tight joints are also incorporated into the design, so that several booms may be joined together. In addition, most booms also employ chain, steel cable, or other similar material, in order to achieve increased structural strength. All commercially produced booms are based on these principles, although they may vary in sophistication.

2) Types and Uses of Booms

a) Curtain Booms

These booms consist of a surface float acting as a

barrier above the surface and a subsurface curtain suspended from it. The curtain is flexible along the vertical axis. It may or may not be stabilized by weights to provide greater resistance to distortion by subsurface currents and have a chain or welded wire rope to transfer stress along the barrier. *EPA 24-23

This type of boom is generally used as a permanent barrier in calm waters, although it can be employed in offshore clean-up operations.

b) Fence Booms

These booms have a vertical fence or panel extending both above and below the surface of the water to provide freeboard to counteract wave carryover and draft below the water surface. The floatation assembly is generally bonded to the fence material. The lower edge of the panel is frequently stabilized and strengthened by a cable or chain. The distinction between the size of the booms is generally one of weight and dimensions. *24-23

(1) Light Fence Booms

This boom is generally no greater than 18" in total height, having an approximate freeboard of 6" and an approximate draft of 12". This boom is generally fairly light, around 1.5 pounds per foot and a 100' section can be carried and deployed by two men. This boom can be effectively used in fairly shallow waters and can be manually carried into areas inaccessible by conventional means. Also, because of its size, this boom can be more easily stored and deployed than most of the larger booms.

(2) Medium Fence Booms

This boom is generally no greater than 36" in total height. This usually allows for a freeboard of 8" to 12" and a draft of 12" to 24". This boom is more cumbersome than the light fence boom due to its greater size and weight (approx. 2.5 to 3 pounds per foot). Because of its size, it must be transported to the spill site and its deployment may require up to four men. This boom is used to contain spills in fairly calm open water.

(3) Heavy Fence Boom

This boom may be 48" or more in total height. It may have a freeboard greater than 24" and a draft of more than 36". This is a rugged, heavy duty boom designed to contain spills at sea.

c) Sorbent Booms

These booms are composed of oleophilic - hydrophobic materials. They float on the surface of the water and generally have no skirt, or panel. These booms can be used as absorbent barriers to control industrial discharges or to contain oil in calm waters. They are light, when not saturated and can be conveyed to remote spill sites. When saturated they become very heavy and often several men are required to remove them from the water. They are also disposable by incineration.

3) Boom Limitations

Booms are not fully effective in containing oil in current exceeding 1.5 knots. At this point, entrainment occurs causing the oil to pass underneath the boom. Because of this, booms are most effective in calm waters. Similarly, when boom is towed, care must be taken to ensure that the tow speed does not create entrainment.

Wind also effects a boom's performance. Too much sail (freeboard) will cause a boom to flatten out in high winds. However, if the freeboard is not sufficient, much oil will be carried over the boom in choppy waters.

Wave action also effects a boom's efficiency. A boom must be capable of conforming to wave profile and vertical stability must be great enough to overcome the roll effect set up by water current on the fin.

From this brief discussion, it can be seen that some care must be taken in choosing a boom. In order to be most effective a lot of thought should go to the type of boom required by a situation.

4) Deployment

a) Harbor

Within the calm waters of a harbor, booms may be used as permanent barriers, deployed in places where spills are likely to occur, such as sea-side facilities which routinely transfer petroleum. They may also be deployed on a temporary basis to contain spilled oil or to divert oil from sensitive areas such as lobster pounds or marinas.

b) Open Waters

In open water, booms are used to contain and collect spilled oil. The effectiveness of these operations is directly effected by weather conditions. As a rule, unless optimum weather conditions prevail, open sea booming is generally ineffective.

In open water, booms can be towed between two boats and thus corral spilled oil. Once this oil is entrapped, it may then be removed by skimmers, sorbents, or mechanical means.

c) Lakes

Booms may be employed in lakes in a manner similar to that described in a) and b).

d) Rivers and Streams

Booming in rivers and streams can be difficult as there is generally a current to deal with. In the case of swift currents, booming is not practical. When this occurs the only course of action is to find an area downstream where the current is less or where an eddy occurs. In both cases, a method known as deflection booming may be employed (see figure 1.) In deflection booming, a boom is placed in position so that a vee is formed with the shore. Oil coming from upstream will strike the boom and slide down along it to be contained near the shore where it can be recovered. Sometimes a series of booms may be employed so that oil escaping the first boom will be captured by subsequent booms.

e) Industrial

Industries at times may employ containment, or sorbent boom, to collect pollutants being discharged with the plant's effluent.

5) Choosing a Boom

When choosing a boom, several things should be considered. The following discussion examines some of these.

a) Transportability

The boom should be designed for easy transportation to a spill site. If the boom is cumbersome, valuable time may be wasted in getting it to the site.

b) Ease of deployment

Boom should have the capacity to be easily deployed. Time lost in deployment will hamper any oil spill containment.

c) Compatibility

The boom should be compatible with other boom and the oil spill recovery equipment. If the boom cannot be successfully integrated with the entire system, then its effectiveness is lessened.

Figure 1.

b. Other Collection Methods

1) Weir Dams

The weir dam (see figure 2.) is a structure designed to collect and contain oil from small streams. A weir is a dam specially constructed to allow the water to pass through its base. The lighter-than-water oil will float on the water's surface and be trapped by the upper portion of the dam. This technique is most effective in fairly slow currents where the water level fluctuation is not great.

2) Filter Fences

A filter fence (see figure 3.) is used to contain and collect oil spilled into small streams and drainage ditches. The filter fence is constructed by placing an open wire mesh fence across a small stream or drainage ditch. Sorbent materials are then placed in the water upstream and allowed to float down to the fence where they are held in place by the wire framework. The sorbent material will then trap and contain the oil coming from upstream.

If the direction of flow changes, as happens in tidal waters, then it is necessary to construct a double fence consisting of two fences with the sorbent materials between them. These double fences can then be deployed above and below the spill in such a manner as to contain the spilled oil. If the stream is small enough bales of hay may be used as filtering agents without the fence. These bales are placed in the stream in such a way as to allow the water to pass through them. However, as they absorb water also, they should be checked often and replaced as needed.

3) Separators

Separators are devices constructed to remove oil from water by physical means, such as gravity separation. These are generally permanent structures employed in final step removal of oil from water before the water is discharged into another body of water. Separators are considered efficient if their discharge contains less than 15 ppm of oil.

3. Recovery Methods

Once an oil spill has been contained, the oil must be physically removed from the environment. This may be accomplished by several methods including suction, mechanical skimmers, or sorbents. The following discussion briefly outlines these methods.

WEIR DAM

Figure 2.

Figure 3.

a. Suction

When a large amount of petroleum is deposited in a thick layer upon the surface of the water, a pump can be used to remove the oil. Most any heavy duty pump may be employed for this purpose. However, vacuum trucks have been proven to be the most effective.

b. Mechanical Skimmer

These are mechanical devices which physically remove oil from the water's surface (see figure 4.) They range in size from large self-propelled barges to small saucer units capable of operating in as little as a foot of water. The basic skimmer is composed of three units, (1) the pickup head, (2) a pump system, and (3) an oil/water separator. The following briefly discusses each of these units.

1) The Pickup Head

a) Weir Type

This type removes oil from the water's surface by allowing the oil to overflow a weir into a collecting device. Once the oil has been collected it is then pumped to a holding tank.

b) Floating Suction

This system operates on the same principle as the household vacuum cleaner. The unit is generally small in size and is connected to the oil/water separator by either a suction or a pressure hose. The floating head may limit the amount of water by a system of weirs or by the design of intake openings.

c) Absorption Surface Type

This type works on the principle that a hydrophobic and oleophilic surface will be preferentially wetted by oil and not water. As the absorbent surface is drawn through the slick, oil will cling to it. This oil is then removed by rollers, wringers or wiper blades. The surfaces are constructed of aluminum or various oleophilic foams or fibers.

2) Pump System

a) Centrifugal Pumps

The centrifugal pump can handle large volumes of flow which may be required to remove very thin slicks. However, this type of pump imparts tremendous mixing energy and produces an oil/water emulsion which may not separate satisfactorily in the settling chamber. These pumps also require priming.

WEIR TYPE

FLOATING SUCTION

ADSORPTION TYPE

Figure 4.

b) Positive Displacement Pumps

Positive displacement pumps, while they cannot handle as large a flow, do not mix or emulsify the oil/water mixture. The efficiency of the settling chamber is thus increased. Positive displacement pumps also are easy to repair, unclog, and maintain and do not require priming.

3) The Oil/Water Separator

This essentially is a settling chamber where collected oil separates by gravity from collected water. The water can then be drawn off from the bottom leaving the oil inside the tank.

c. Sorbents

Sorbents are non-toxic oil spill scavengers or clean-up agents which absorb or adsorb oil. Sorbents may be employed in a variety of ways, (1) they may be cast loose upon the water and collected later, (2) they may be contained in porous materials, or (3) they may be fashioned into blankets or pads. Sorbents may be (1) natural products such as hay, straw, or sawdust, (2) modified natural products such as sawdust covered with silicon or activated carbon, or (3) synthetic materials, such as polymers and styrenes. Depending on the nature of the sorbent material, sorbents can be used to recover most any type of oil.

1) Sorbent Disadvantages

a) Sinking

Some sorbents, particularly natural ones, will eventually become waterlogged and sink making recovery difficult.

b) Recovery

Some absorbents, because of their absorbent qualities, become very heavy when saturated with oil. When this occurs, these sorbents may be very difficult to remove from the water due to their increased weight.

c) Wind

Many sorbents are light in nature and may be blown away before they become saturated.

d) Fast Currents

Absorbents are generally ineffective in fast flowing waters as the oil is swept past the sorbent before it can be absorbed, however, they can be utilized with a deflection boom in some cases.

e) Tidal Waters

In tidal waters sorbents should be deployed in such a manner that they are not standing as the tide goes out.

f) Icing

In cold weather sorbents may become frozen within the ice making them difficult to remove.

g) Debris

In areas choked with debris, the debris should be removed before deploying the sorbent material.

4. Other Oil Spill Clean-up Techniques

a. Incineration

Spilled oil may be burned from the surface of the water under certain circumstances. However, this method should never be employed without fully considering its consequences and limitations. Freshly spilled oils and crudes containing volatile components are relatively ignitable.

With thick layers of oil, generally those greater than 1/8 inch in thickness, the oil will sustain burning until the volatiles and a fraction of the heavier components are combusted. However, as an oil spill spreads it becomes thinner and its greater surface area allows for more rapid loss of volatile vapors and for greater emulsification with water. Additionally, the slick is affected by the water temperature. The colder a body of water is the more difficult it will be to ignite due to the conduction of heat losses into the water.

To enhance the burning of oil on the surface of the water, the following techniques have been employed:

- 1) Wicking Material - This is a material which acts as a wick drawing the oil from the water by capillary action into the burning zone.
- 2) Local Heating by a Secondary Flame Which Makes Up for Heat Losses to the Water - This is achieved with flame impingement or by burning more volatile fuel in pools on the surface of the spilled oil.
- 3) Addition of Oxidants - These materials produce higher flame temperatures which, in turn, can generate more fuel vapor to sustain burning.

Burning of oil should never be attempted under adverse conditions where there is the chance that it may get out of control. Also, extreme care and judgement should be taken whenever burning highly volatile oils under any conditions.

5. Chemical Treatment of Oil Spills

Historically, a wide variety of chemical compounds have been used to combat oil spills. Research indicates that many of these compounds may be more hazardous to the environment than the oil that it "cleaned up". With this in mind, the EPA and the D.E.P. have adopted strict regulations concerning the use of chemicals in controlling oil spills.

Chemical agents are broadly categorized as follows:

a. Dispersants

Those chemical agents or compounds which emulsify, disperse or solubilize oil or act to further the surface spreading of oil slicks in order to facilitate dispersal of oil into the water column.

b. Sinking Agents

Those chemicals or other agents that can physically sink oil below the water surface.

c. Collecting Agents

Those chemical or other agents that can gel, sorb, congeal, herd, entrap, fix or make the oil mass more rigid or viscous in order to facilitate surface removal of oil.

B. Control and Clean-up of Oil Spilled on Land

1. Introduction

Once oil has been spilled on the land every precaution should be taken to assure that it does not reach any body of water, including groundwater. Removal of oil from the land follows the same steps as those outlined for the removal from water. First, the spill must be contained, second, it must be removed and third, it must be disposed of in an acceptable manner. The following discusses two of these steps: containment and removal.

2. Containment

To contain a spill on land, its downward penetration, as well as its lateral migration, must be curbed. In the first instance, this may not always be possible. In the second, a dike, or berm, should be constructed to intercept and contain the spilled oil. Once the spill has been successfully contained, then removal can proceed.

3. Removal

Once the oil has been contained removal can be accomplished by employing the same methods as those used for removing oil from water. Generally, a vacuum truck is the most efficient removal tool in this type of situation, although other methods may be required because of circumstances.

After the free oil has been removed, it is necessary to strip the contaminated topsoil from the spill site to assure the oil is completely removed from the environment. This must be done by physical removal employing mechanical means, or physical labor. Once the contaminated topsoil has been removed then it must be disposed of in an acceptable manner.

C. Oil on the Shoreline

1. Introduction

Shoreline restoration demands either the physical removal of the upper layers of the beaches or processing each grain of contaminated sand and every square inch of oil-covered rock surface, a process made very difficult by the physical adhesion and absorption of the oil. The diversity of the topography, the tidal range, and the physical, biological, and geological structure of the shoreline makes restoration difficult, at best.

In all major oil pollution catastrophies of the last few years, the methods of restoring the shoreline were essentially the same - brute force and labor.

In every case men and machinery were used to deploy available materials (e.g. absorbing agents like straw, sawdust, etc.). Construction equipment, pumping machinery and vehicles were also used. Oil pollution control contractors experienced in cleaning coastline areas primarily used standard construction equipment and vacuum trucks to collect and remove the contaminated materials.

2. Clean-up Methods

The methods employed to clean-up oil from Maine's extensive shoreline is greatly dependent upon several factors. However, the two main factors which will be discussed in this section are the type of oil spilled and the character of the shoreline.

The type of oil which is spilled and impacts the shoreline will, to a great extent, determine the clean-up technique which is employed. Heavy oil such as "Bunker C" impacting a sandy beach is probably the least difficult to remove. The heavy oil being quite viscous does not penetrate the sands to any great depth. Thus, the oil can be raked into "windrows" and picked up with shovels or front end loaders for later disposal. If the contamination is quite severe, a layer of sand can be removed by scraping the first few inches of beach with a motorized scraper such as a road grader. Caution should be taken to remove as little beach material as possible and still do an adequate clean-up job.

It is much easier to clean-up a beach if the oil is stopped at or near the waterline. An effective method of protecting a high-use beach from the onslaught of oil pollution is to throw up a sand berm approximately three feet high. This can be accomplished with the use of earth moving equipment, or, if necessary, by hand labor. The artificial berm should be placed along the high water mark, to protect the dry sand above the intertidal zone. If the surf is strong or very active, or if there is an abnormally high tide, the artificial berm will be destroyed. The artificial berm will only prove effective in mild surf and calm weather.

Should sufficient time exist between the notification of an oil spill and its reaching the shore face, one method of alleviating the damage to the beach is the use of straw either alone or used in conjunction with commercial sorbents. Straw, which has a natural absorptive capacity for oil, will absorb between four and ten times its own weight in oil. To be most effective, the straw should be laid along the low water mark and as the tide and oil move up the beach, the straw should be worked into the oil. If this method is employed one should remember that the straw is much easier to deploy than to recover. Furthermore, the wind and currents may carry the straw away from the area with a change in tide. Therefore, adequate man power to recover all materials must be available.

Clean-up of heavy oils on rocky shores is much more difficult than sandy beaches. Usually access to the area by vacuum trucks and other heavy equipment is extremely limited. In such instances, clean-up may be done almost entirely by manual labor. If pumping equipment can be transported to the site, (either over land or by water) pockets of oil can be pumped into holding tanks. Where access is limited, pools of oil must be gathered in small containers or recovered with sorbents. The remaining oil coated shoreline can be dealt with in several ways. Shorelines composed of large rocks and rock outcroppings must be cleaned by wiping with rags or other suitable material. If the area is relatively accessible, the rocks may be cleaned by hydroblasting or steam cleaning. The oil thus removed is recovered with sorbents.

On beaches consisting of smaller rocks it may be practical to collect and remove the most contaminated beach cover. Very lightly contaminated areas are sometimes left for nature to take care of.

Light oils such as #2 fuel oil and kerosene present a different clean-up problem than the heavier oils. The lighter oils are much more water soluble, more toxic to the environment and penetrate the beach sediments much more rapidly than the heavy oils.

Once light oils impact a shoreline, be it sandy or rocky, the oil penetrates the porous spaces available to the oil. This is particularly true on sandy beaches where deep penetration is immediate. In such instances, it is usually not practical to remove large amounts of beach material. Instead the usual practice is to expose as much of the oil to evaporation through wind and weather.

To accelerate the evaporation and dissipation of #2 fuel oil from sandy beaches, a mat of straw should be laid on the beach, at least one inch thick. A disk-harrow should then be used to work the straw into the sand column so that the straw can absorb as much of the oil as possible. A beach cleaning machine should then be used to retrieve the oil soaked straw. The beach should then be harrowed or mechanically raked to hasten the dissipation of the remaining oil trapped in the sub-surface of the sand.

In severe cases, it may be possible to dig trenches near the water line to collect the oil as it seeps from the upper beach areas. This collected product can then be recovered with skimming devices or sorbents or burned in place if other recovery methods are impractical.

When light oils come ashore on rocky shores, the most practical means of clean-up may be to mop up pockets of oil collected in rock pools with sorbent materials. Where access is limited to hand carried equipment, trenches dug by shovel below the rocky ledges may collect significant quantities of oil. As with sandy areas, this oil may be recovered or burned on site, depending on the local conditions.

In general the clean-up of oil from the shoreline is a man power intensive job. Many times heavy equipment is of little value due to limited access and rocky terrain. In these instances the shovel, rake, open drum and muscle power are the most important clean-up tools.

3. Beach and Sediment Removal

The removal of any amount of soil or sediments from land adjacent to a body of water may cause future erosion problems. In light of this, the D.E.P. requests that the Department of Conservation, Bureau of Geology (289-2801), be notified of any soil removal action involving land adjacent to any body of water where the possibility of such erosion problems may exist. This is particularly true of beaches which are exposed to the ocean.

D. Oil in Groundwater

1. Introduction

The movement of petroleum products in soil varies with the volume of the product, the physical properties of the product, the structure of the sub-soil, the nature of the groundwater system, and the weather. Experience has emphasized the wisdom of securing advance information on soil properties and groundwater systems in areas which may be subject to spills. The mechanisms of migrating oil in soils are complex, but where sufficient data is available it is possible to predict whether a given amount of oil is likely to reach a water table or to estimate the depth to which it is likely to migrate in the soil. When a large amount of hydrocarbon is involved, skilled hydrological help should be enlisted.

Oil spilled on undisturbed ground will move downward at a rate dependent on the viscosity of the oil and permeability of the soil. The downward movement eventually will be interrupted by one of three events: (1) The oil will be exhausted to immobility, (2) It will encounter an impermeable bed, or (3) It will reach the water table.

Exhaustion to immobility or the encounter of an impermeable bed only lessens the risk of groundwater pollution. It does not remove the likelihood of contamination.

Most of the insoluble oil fractions that reach a water table will be suspended or will float at or near the surface of the water. The oil will tend to move with the water, but it will be absorbed continually by soil particles that it contacts. Thus the volume of oil being transported will shrink. If the water table drops, the oil will follow, some of it being picked up to continue to move laterally with the groundwater.

When rain water passes through the oil in the soil it will pick up soluble fractions of the oil and carry them into the groundwater system. The net result of oil-groundwater-soil interaction causes the hydrocarbons to travel more slowly than the groundwater, thus persist longer in a given area.

2. Removal of Oil from Groundwater

Once oil has entered the groundwater it is almost impossible to remove. Contaminated groundwater may ruin a potable water source for generations to come. Although all of the oil cannot be recovered from groundwater by present methods there are two techniques which have been used to recover much of the oil and, thus, minimizing the amount of water that will be affected. These two techniques are (1) digging recovery wells and (2) digging ditches or trenches.

a. Wells

This method employs the technique of pumping water from a well to create a local depression in the water table. This local depression interrupts the water flow, causing the water

to move towards the well. Oil that is floating on top of the water table is similarly carried to the low point of this depression and is pumped out along with the water. In order to be effective the depression must be maintained at all times (see figure 5.).

b. Ditches

In using this technique a ditch is constructed across the front of the migrating body of oil and below the top of the water table. As the oil floats across the ditch it is skimmed off the surface of the water. At times a barrier constructed of impermeable material such as polyethylene plastic or plywood, may be placed in the ditch on the "downstream" side to hold the oil in the ditch and make recovery more efficient (see figure 6.).

WELL RECOVERY

Figure 5.

DITCH RECOVERY

Figure 6.

XIII. Use of Dispersants, Sinking Agent, Biological Agent,
and other Chemical Agents

A. Dispersants and Sinking Agents

1. Authorized Use

Dispersants or sinking agents may be used on or in the waters of the State of Maine only when a Department Representative specifically authorizes their use in designated quantities when and only when their use will:

- a) In the judgement of the Department Representative prevent or substantially reduce hazard to human life or limb or substantial hazard of fire to property.
- b) In the judgement of the Department Representative, in consultation with appropriate Federal and State agencies, prevent or reduce substantial hazard to major or important segments of vulnerable species of waterfowl.
- c) In the judgement of the Department Representative in consultation with appropriate Federal and State agencies result in the least overall environmental damage or interference with designated uses.

2. Pursuant to Annex X of our National Contingency Plan the following five (5) chemicals have been accepted for use as dispersants.

- a) Gold Crew Dispersant
- b) Sea Master NS-555
- c) Cold Clean
- d) Altantic Pacific Oil Dispersant
- e) BP 1100X

The use of any other chemical dispersant is prohibited.

B. Biological Agents and Other Chemical Agents (Surface Collecting Agents, etc.)

The use of biological agents and surface collecting agents will be authorized only by the D.E.P. on scene representative after consultation with the U.S. Environmental Protection Agency. The surface collecting agent OIL HERDER and the biological agent NOSCUM are the only products accepted by EPA, as of December 13, 1977.

XIV.

Disposal of Recovered Materials

All disposal procedures should follow Department of Environmental Protection guidelines. In selecting a method, or methods, for final disposition of recovered contaminated material the following should be considered.

Recovered oil may be disposed of in the following ways: recycled, incinerated, placed on an approved land disposal site, buried, or by other means such as road oiling.

Recycling is the preferred method as no petroleum pollutants enter the environment and a vital resource is conserved.

If recycling is not feasible then incineration is recommended.

If the material to be disposed of is not severely contaminated it may possibly be disposed of in certain licensed sanitary landfills. The final judge as to the degree of contamination shall be the on scene D.E.P. representative. Other alternatives may be to use the oil soaked sand in the production of cold patch or other similar asphaltic materials, or to use the oil soaked sand, gravel and rocks in the construction of road beds, if they are above the high water table, confined to the area within the limits of paving and placed in a thin layer within a few feet of the paved surface.

Burial may be necessary if no other means of disposal are feasible. Burial is discouraged as (1) the petroleum still exists and may cause future recontamination of the environment, (2) the burial of petroleum contaminated debris is a new science and is still being researched, (3) adequate burial sites and means may not be available near the spill area.

GUIDELINES

1. Recycling: All recyclable oil should be collected and taken to a reputable used oil recycling dealer.
2. Burning:
 - A. Incineration - Whenever feasible oil contaminated materials shall undergo complete combustion in a D.E.P. approved/licensed incinerator. The ashes and other residue from this operation shall be disposed of in a sanitary landfill. A D.E.P. representative shall make the final decision as to the disposition of these by products.
 - B. Open Burning - If incineration is not feasible than the oil contaminated debris may be burned in the open if the following criterial are met:
 - 1) Permission to burn is obtained from the local fire warden or forest ranger.
 - 2) Permission to burn is obtained from the local fire department.
 - 3) Permission to burn is obtained from the D.E.P.'s Bureau of Air Quality Control.
 - 4) A D.E.P. representative is on scene to supervise the oil-burning operation.
 - 5) There is no other practical way of disposing of the oil contaminated material. The ash and other residue shall be disposed of in an environmentally safe manner. The on scene D.E.P. representative shall make the final decision as to the final disposition of these by-products.
 - 6) The burning shall be done in such a manner as to not pose a hazard to life, property, public health, safety, welfare, or create a nuisance.
3. Burial: (These guidelines follow those proposed in the 1975, E.P.A. Region I, Oil and Hazardous Substances Contingency Plan, Volume II, Sub-regional Plan Outline, Section 3125)
 - A. Oily waste disposal site

The oily waste disposal site shall be located in an area where there exists no danger of pollution to any waters of the State, coastal waters, estuaries, tidal flats, beaches and lands adjoining the seacoast of the State, or into any river, stream, sewer, surface water drain or other waters of the State.
 - B. Soil

The soils of the site shall be adequate to prevent the rapid percolation of leachate (if any) into the groundwater. Soils with a percolation rate greater than that of silty fine to medium sand (AAHO designation) shall not be acceptable. Existing soil conditions shall be determined by test pits and/or borings. Final judgement as to the suitability of the soil for disposal purposes shall be made by the Board of Environmental Protection.
 - C. Surface Flooding

The site shall not be subject to flooding from surface waters.

D. Separation Layer

The site selected shall have sufficient undisturbed soils to provide at least a four foot vertical separation between the high groundwater table and the base of the earth seal. The groundwater table shall be determined by test pits and/or borings and adequate allowances made for seasonal variations.

E. Previously used areas

The site used for the disposal of oil soaked debris shall not be located on the surface of any previously placed refuse layers, except those areas used for the disposal of oil soaked debris in accordance with these guidelines.

F. Future refuse disposal

The site selected shall not be covered with any refuse without prior approval from the D.E.P.

G. Monitoring wells

Wells shall be established to monitor for possible leaching of the oil into groundwater. One well shall be placed in the center of the disposal site. Other wells shall be placed in manner so that the migration of the oil in any direction can be detected. The wells shall extend below the water table. The establishment of these wells shall be supervised by the D.E.P. These wells shall be checked every thirty days for a period of five years. A log shall be kept of these observations and be made available to D.E.P. representatives.

H. Site selection for oily debris disposal shall be made in consultation with D.E.P.'s Division of Solid Waste Management.

XV.

Oil Wildlife AssistanceU.S. Fish and Wildlife Service

In the event of a major oil spill involving migratory birds, the following USFWS personnel within Region 5 shall be notified:

Fish and Wildlife Service, Area III (ME, NH, VT, MA, RI, Conn.)

Field Coordinator, Maine Coast
Michael Hendrix, Hatchery Mgr.
Craig Brook NFH
East Orland, ME

FTS: 8 883-7271
COMM: (207) 469-2803
HOME: (207) 469-7253

Alternate for New England Area
Bob Currie, ES, Concord, NH

FTS: 8 834-4726 / 4762
COMM: (603) 224-2585 / 2586
HOME: (603) 648-2257

Area Manager, Concord, NH
Charles Maloy

FTS: 8 834-4717 / 4718
COMM: (603) 224-9558 / 9559
HOME: (603) 224-5176

Fish and Wildlife Service, Region 5

Regional Oil Spill Coordinator
Allen C. Jackson, ECE
Newton Corner, MA

FTS: 829-9217
COMM: (617) 965-5100 EXT. 217
HOME: (603) 434-9408

Alternate 1
Regional Oil Spill Coordinator
Arnold M. Julin, ECE, Newton Corner

FTS: 829-9217
COMM: (617) 965-5100 EXT. 217
HOME: (603) 893-9348

Alternate 2
Regional Oil Spill Coordinator
Curtis Laffin, OBS, Newton Corner

FTS: 829-9217
COMM: (617) 965-5100 EXT. 217
HOME: (603) 889-4643

Fish and Wildlife Service, Washington D.C.

U.S. Fish and Wildlife Service Equipment Available for Use at Oil Spills
 Region 5, Area III (Maine):

Wildlife Assistance - Augusta, Maine

2 shotguns
 2 propane cannons
 100 shell crackers (varies) amount on hand

Moosehorn NWR - Calais, Maine

14' aluminum, semi-vee bottom, w/18 hp Johnson outboard motor
 17' square stern aluminum canoe, w/1-½ hp Evinrude outboard motor
 1965 Chevrolet Pick-up truck, 4x4 w/winch
 1965 I-H Scout, 4x4
 4-6 duck traps, portable 4'x10'

Craig Brook NFH - East Orland, Maine

12' fiberglass boat, w/outboard motor
 1953 Jeep, 4x4, ½ ton
 1966 I-H pick-up truck, dump bed, 4x4, ¾ ton
 12 gauge shotgun, pump
 3 long-handled dip nets

Green Lake NFH - Ellsworth, Maine

13' 6" Boston Whaler, w/20 hp Mercury outboard motor
 trailer for above boat
 pick-up, 4x4, ¾ ton
 12 gauge shell crackers

District #13 - Augusta, Maine (Law Enforcement)

2 boats
 1 4-wheel drive vehicle
 50 rounds of shell crackers
 1 dip net
 mobile radios - 2 State and Federal frequencies
 portable radios - 2 Federal frequencies

Other U.S. Fish and Wildlife Service Assistance

For Federal migratory bird holding permit, contact:

Thomas F. Wharton, Jr.
 Senior Resident Agent
 New Federal Building
 Room 221A
 55 Pleasant Street
 Concord, New Hampshire 03301

U.S. Fish and Wildlife Agent (Maine), contact:

Frank Gramlich (207) 622-6171
 U.S. Fish and Wildlife Agent HOME: (207) 685-4346
 40 Western Avenue
 Augusta, Maine 04330

Interest: Any medium or major oil spill involving birds or fish.
 Has a recall list of personnel volunteering to clean oily birds.

National Marine Fisheries Service

In the event of a major oil spill involving marine mammals, the following organization shall be notified:

John Nicholas
National Marine Fisheries Service
Woods Hole, MA 02543

(617) 548-5123

State of Maine

In the event of a major oil spill involving oily wildlife, the following State agencies shall be notified:

Department of Environmental Protection

Division of Oil Conveyance Services	
Marc Guerin, Chief	289-2591
Bangor Field Office	947-6746
Portland Field Office	773-6491
Toll Free Oil Spill Number	1-800-482-0777

Bureau of Water Quality Control	
Stephen W. Groves, Director	289-2591

Office of the Commissioner	
Henry E. Warren, Commissioner	289-2811

Department of Inland Fisheries and Wildlife

Wildlife Research Division	289-3651
Robert W. Boettger, Chief	
Lee E. Perry, Assistant Chief	
Regional Headquarters	289-2536

Fisheries Research Division	289-3651
Lyndon H. Bond, Chief	
Robert E. Foye, Assistant Chief	

Hatchery Division	289-3651
David O. Locke, Superintendent	

Warden Service	289-2766
Alanson B. Noble, Chief Warden	

Administration	289-2766 / 3371
Maynard F. Marsh, Commissioner	
J. William Peppard, Deputy Commissioner	

Department of Marine Resources

Research Division	289-2291
Robert L. Dow, Director	
Dana E. Wallace, Assistant Director	
Jon Hurst (West Boothbay Harbor)	633-5572
Brad Sterl (Ogunquit)	646-3322

Enforcement Division	289-2291
Donald D. McIntosh, Chief Coastal Warden	

Administration	289-2291
Vinal O. Look, Commissioner	
Richard P. Choate, Deputy Commissioner	

Volunteers - Environmental Organizations and Community Animal Shelters

In the event of a major oil spill involving oily wildlife, the following environmental organizations and community animal shelters shall be notified.

Maine Audubon Society (207) 781-2330
Gilsland Farm Road
Falmouth, Maine
Mr. William Ginn

National Audubon Society (518) 773-5690
Northeast Regional Office
P.O. Box 151
Stephentown, New York 12168
Mr. Richard C. Rhindress

Sierra Club (617) 742-9310
New England Chapter
14 Beacon Street, Room 719
Boston, Mass. 02108
Mr. Tom Arnold, Chairman

Friends of the Earth (617) 742-6329
Regional Representative
3 Joy Street
Boston, Mass. 02108
Ms. Ann Roosevelt

Community Animal Shelters

The Bangor Humane Society (207) 942-8902
693 Mt. Hope Avenue
Bangor, Maine 04401

Down East Animal Welfare (207) 244-3178
Woods Street
Southwest Harbor, Maine 04679

Kennebec Valley Humane Society (207) 623-8765
Pet Haven Lane
Augusta, Maine 04330

Lewiston-Auburn SPCA (207) 783-2311
Old Poland Road
Auburn, Maine 04210

Boothbay Harbor Humane Society (207) 633-4457
Boothbay Harbor, Maine 04538

Brunswick Humane Society (207) 725-5051
Golf Link Road
Brunswick, Maine 04011

Animal Welfare Society (207) 985-3244
Holland Road
West Kennebunk, Maine 04094

Humane Society of the United States
2100 L Street, Northeast
Washington, D.C. 20037

Day: (202) 452-1100
Nite: (703) 860-9386
or 560-6481

Edward Jordan
Wells Road
Cape Elizabeth, Maine

(207) 799-7198

Interest: Duck producer; available to take a small number of birds
for cleaning; has a Federal migratory bird permit.

Dr. Ray B. Owen, Jr.
Associate Professor of Wildlife Resources
School of Forest Resources, University of Maine
Orono, Maine 04473

(207) 581-7388

Interest: Waterfowl studies; in charge of university duck pens (black
ducks).

Office and Organizations Which Can Provide Assistance or Information

In the event of a major oil spill involving oily wildlife, the following office and organizations may be able to provide assistance or information.

Office of Migratory Bird Management (207) 343-8827
U.S. Fish and Wildlife Service
Room 2249, Interior Building
Washington, D.C. 20240

Humane Society of the United States Day: (202) 452-1100
2100 L Street, NW Nite: (703) 860-9386
Washington D.C. 20037 or 560-6481

International Bird Rescue (415) 841-9086
Research Center
Aquatic Park
Berkeley, California 94710
Mr. David C. Smith

Wildlife Rehabilitation Center (618) 529-3700

230 Marcus Boulevard
Hauppauge, L.I., N.Y. 11787
Mr. Alfred R. Globus
POLYCOMPLEX A-11 (\$6.95 per gal.)

XVI. Scientific, Consulting, and Advisory Community Assistance

In the event of a major oil spill, the following individuals and organizations might be contacted for their expertise in various fields:

Out-of-State

William Andrade (617) 861-6700
U.S. EPA, Region I EXT. 277
60 Westview Street
Lexington, Mass 02173
Interest: Chemical analysis / fates.

Dr. Frank G. Lowman (Water column biology) (401) 789-1071
Dr. John H. Gentile (Laboratory toxicity)
Mr. Paul P. Yevich (Histopathology)
Dr. Jan C. Prager (Socioeconomic / legal)
Environmental Research Laboratory, EPA
So. Ferry Road
Narragansett, RI 02882

Dr. J. Lawrence Dunn (401) 792-2334
233 Woodward Hall
University of Rhode Island
Kingston, RI 02881
Interest: Marine birds and mammals.

Dr. Kevin Powers (617) 224-3359
Manomet Bird Observatory (Rm. 1806)
Box 0
Manomet, Mass. 02345
Interest: Marine birds.

Dr. Peter H. Fricke (617) 548-3705
Woods Hole Oceanographic Institute
Woods Hole, Mass. 02543
Interest: Socioeconomic / legal aspect.

Dr. John H. Prescott, Director (617) 742-8830
New England Aquarium, Room 1924
Central Wharf
Boston, Mass. 02110
Interest: Marine birds and mammals.

In-State

Natural Resources Council of Maine (207) 622-3101
51 Chapel Street
Augusta, ME 04330

Dr. Dana W. Mayo (Isolation marine hydrocarbons) (207) 725-8731
Dr. David S. Page (Sample analysis) EXT. 601
Dr. Edward S. Gilfillan (Biological monitoring) EXT. 602
Dr. Ray P. Gerber (Water column biology)
Department of Chemistry
Bowdoin College Marine Research Laboratory
Bowdoin College
Brunswick, Maine 04011

Dr. Peter Larsen (Estuarine ecology) (207) 633-2173
 Lee F. Doggett (Intertidal and subtidal benthos) EXT. 29
 Susan C. Sykes (Intertidal ecology) EXT. 34
 Veronica M. Berounsky (Benthic/intertidal marine
 invert.)

Jean F. Chenoweth (Benthic invert. of coastal Maine)
 Bigelow Laboratory for Ocean Sciences
 McKown Point
 W. Boothbay Harbor, Maine 04575

Harry R. Tyler, Jr. (Planner/ biologist) (207) 289-3261
 Maine State Planning Office
 184 State Street
 Augusta, Maine 04333
 Interest: Identification of critical areas in Maine.

Dr. Garrett C. Clough, Vice President (207) 353-6534
 New England Coastal Oceanographic Group
 Lisbon Falls, Maine 04252
 Interest: Conservation of critical environments and endangered
 species; coastal and island ecology.

Bob Doyle (207) 289-2801
 Walter A. Anderson
 Bureau of Geology
 Maine Department of Conservation
 Augusta, Maine 04333
 Interest: Environmental geology

Glenn C. Prescott, Jr., Supervisory Hydrologist (207) 623-4797
 U.S. Geological Survey, Water Resources Division
 26 Ganneston Drive
 Augusta, Maine 04330
 Interest: Groundwater hydrology; marine geology.

Howard E. Spencer, Jr., Migratory Bird Resources Leader (207) 581-2507
 Maine Department of Inland Fisheries and Wildlife
 238 Nutting Hall, University of Maine at Orono
 Orono, Maine 04473
 Interest: Littoral zone waterfowl habitat.

Alan E. Hutchinson, Wildlife Biologist (207) 581-2506
 Maine Department of Inland Fisheries and Wildlife
 220 Nutting Hall, University of Maine
 Orono, Maine 04473
 Interest: Sea and shore birds; environmental impact appraisals.

William C. Reed, President (207) 582-4205
 Center for Natural Areas
 Box 98
 So. Gardiner, Maine 04359
 Interest: Marine resources management.

James S. Chalfant, President (207) 644-8180
 MARITEC
 So. Bristol, Maine 04568
 Interest: Management of commercial resources of intertidal zone;
 Long Cove study.

- Dr. Donald B. Horton, President (207) 799-1340
 TRIGOM
 21 Vocational Drive
 So. Portland, Maine 04106
 Interest: Estuarine ecology; fish behavior.
- Dr. Leslie E. Watling (Estuarine ecology) (207) 563-3146
 Terry L. Cucci (Pollution ecology)
 Seth L. Barker (Marine ecology)
 Department of Oceanography
 Ira C. Darling Center - University of Maine
 Walpole, Maine 04573
- Dr. Charles W. Major (207) 581-7960
 Professor, Department of Zoology
 University of Maine at Orono
 Orono, Maine 04473
 Interest: Effects of oil fractions on bivalves.
- Edward H. Shenton, President (207) 353-6534
 New England Coastal Oceanographic Group
 Lisbon Falls, Maine 04252
 Interest: Oil spill and effect research.
- Stewart I. Fefer, Res. Assistant (207) 581-7387
 Maine Cooperative Wildlife Research Unit
 University of Maine at Orono
 Orono, Maine 04473
 Interest: Birds of the coastal zone.
- Dr. James R. Gilbert, Assistant Professor (207) 581-7388
 Department of Wildlife Resources
 University of Maine at Orono
 Orono, Maine 04473
 Interest: Grey seals; marine mammals.
- Dr. Irwin D. Novak, Assistant Professor (207) 773-2981
 Department of Earth Sciences, Physics and
 Engineering
 University of Maine at Portland-Gorham
 Portland, Maine 04103
 Interest: Coastal geomorphology; sediment transport in near
 shore zone; beach monitoring.
- Dr. Roy L. Farnsworth, Chairman (207) 783-6011
 Department of Geology
 Bates College
 Lewiston, Maine 04240
 Interest: Near shore and estuarine processes and sediments;
 marine geology.
- Dr. John Barlow, Professor (207) 324-4311
 Department of Oceanography
 Maine Maritime Academy
 Castine, Maine 04421
 Interest: Marine biology; estuarine ecology; fisheries biology;
 oceanography.

Dr. Robert C. Bayer, Assistant Professor (207) 581-7521
Department of Animal and Veterinary Sciences
University of Maine at Orono
128 Hitchner Hall
Orono, Maine 04473

Interest: Lobsters/ aquaculture; commercial fisheries.

Dr. Miriam F. Bennett, Dana Professor/Chairman (207) 873-1131
Department of Biology EXT. 214
Colby College
Waterville, Maine 04901

Interest: Marine flatworms and annelids; invert. and vert. biology.

Dr. David W. Bridges (207) 282-1515
(Fisheries biology; environmental monitoring) EXT. 42
Dr. Joseph G. Yuhas (Effects of pollution on and 15
marine organisms)
Center for Life Sciences
St. Francis College
Biddeford, Maine 04005

Harris J. Bixler, President (207) 594-4436
Marine Colloids, Inc.
P.O. Box 308
Rockland, Maine 04841

Interest: Seaweed chemistry.

Southern Maine Vocational Technical Institute (207) 799-7303
Fort Road
So. Portland, Maine 04106

Interest: Oceanography personnel and research vessels
(AQUALAB III, Captain Brian Hathaway).

XVII.

Hazardous Materials Information

A. OHM-TADS - Oil And Hazardous Materials - Technical Assistance Data System

OHM-TADS is operated by the U.S. Environmental Protection Agency. The purpose of OHM-TADS is to provide emergency information pertaining to spills of hazardous materials. Information on over 1,000 hazardous materials has been cataloged into a computer system for immediate recall. Extensive information on each material is available.

The OHM-TADS system is in operation from 8am to 9pm Monday through Friday and from 8am to 4pm on Saturday. To obtain immediate response through the OHM-TADS system, Call 617-223-7265.

B. Chemtrec - Chemical Transportation Emergency Center

Chemtrec is a 24 hour emergency information center for hazardous chemicals, which is operated by the Manufacturing Chemists Association. The center can provide immediate information relating to hazards and proper response actions to be taken in the event of a hazardous materials spill. It is important that the identification of the spilled material be known before contacting Chemtrec. Chemtrec's Emergency information number is 1-800-424-9300.

C. Chemical Hazards Response Information System (CHRIS)

The Chemical Hazards Response Information System manual is an official publication of the U.S. Coast Guard and consists of the following five volumes:

CG-446-1	Condensed Guide to Chemical Hazards
CG-446-2	Hazardous Chemical Data
CG-446-3	Hazard Assessment Handbook
CG-446-4	Response Methods Handbook
CG-446-5	Regional Contingency Plan

The manual provides timely information essential for proper decision-making by appropriate agencies during emergencies involving hazardous chemicals. It also provides certain basic non-emergency related information to support efforts to achieve improved levels of safety in the bulk shipment of hazardous chemicals. The five manuals contain chemical data, hazard-assessment methods and response guidelines.

Appendices

Appendix I. Law Enforcement Agencies

- A. State Police
- B. County Sheriffs
- C. Local Police
- D. State Game Wardens
- E. State Coastal Wardens

Appendix II. State and Local Fire Protection

- A. State Fire Marshal
- B. Local Fire Chiefs

Appendix III. Clean-up Contractors, Equipment, and Other Services

- A. State Owned Clean-up Equipment
- B. Licensed Terminal Owned Clean-up Equipment -
- C. Non-licensed Terminal Owned Equipment (excluding commercial clean-up contractors)
- D. U.S. Coast Guard Owned Clean-up Equipment
- E. Clean-up Contractors and Equipment of Maine
- F. New England Area Clean-up Contractors
- G. Used Oil Collectors
- H. Emergency Storage for Recovered Oils
- I. Approved Commercial Incinerators for Oily Debris
- J. Heavy Equipment Operators
- K. Truck Transport
- L. Railroads
- M. Commercial Vacuum Trucks and Vac-alls
- N. Septic Tank Services
- O. Tank Testing Companies
- P. Commercial Helicopters
- Q. Commercial Fixed-Wing Aircraft
- R. Marine Contractors
- S. Tow Boats and Vessels
- T. Divers

Appendix IV. State Department of Transportation Highway Maintenance Garages

- A. Presque Isle
- B. Ellsworth
- C. Bangor
- D. Rockland
- E. Fairfield
- F. Dixfield
- G. Scarborough

Appendix V. Oil Spill Cooperatives

Appendix VI. Oil Storage Facilities

- A. Licensed Oil Terminal Facilities
- B. Coastal Bulk Storage Facilities

Appendix VII. Surface Sources of Public Water Supplies

Appendix VIII. Critical Water Use, Recreation and Wildlife Areas

Appendix IX. Department of Environmental Protection - Staff Listing
